

PS ID	Problem Statement	Problem Description	What the Team Has to Do	Key Functional Requirements	Expected output
SIH26-S01	Agentic AI Cybersecurity Assistant for Automated Threat Investigation and Incident Response	Develop an Agentic AI cybersecurity assistant that analyses security logs, detects suspicious activity, correlates related events and assists analysts in investigating and responding to cyber incidents.	Teams must build a working prototype that ingests sample security logs, normalizes events, detects anomalies/threats, correlates multiple events, assigns a risk level, explains the evidence, recommends response actions and generates an incident report. At least two specialized AI agents should collaborate, such as Log Analysis Agent and Threat Investigation Agent.	Log collection/preprocessing; anomaly/threat detection; event correlation; agent orchestration; threat explanation; response recommendation; incident-report generation; dashboard.	working dashboard, sample-log pipeline, threat classification/risk score, evidence-backed explanation, recommended response and downloadable incident report.
SIH26-S02	AI-Based Citizen Grievance Classification, Prioritization and Duplicate Complaint Detection	Develop an AI-based grievance platform that automatically classifies complaints, routes them to the correct department, assigns priority and detects duplicate complaints referring to the same underlying issue.	Create a citizen submission interface and authority dashboard. Use NLP/embeddings to classify complaints, identify urgency, cluster semantically similar complaints and show geographical hotspots.	Complaint intake; language normalization; classification; priority scoring; semantic similarity; clustering; GIS visualization; status tracking; analytics.	Expected output: end-to-end complaint portal with AI classification, routing, duplicate detection and hotspot dashboard.
